

MI-CW3609

Michigan Crop Weather

September 8, 2009

Sunny and Dry

Seven days were suitable for fieldwork during the week ending September 6, according to the USDA, NASS, Michigan Field Office. Precipitation varied from no precipitation in the western Upper Peninsula, northeast, west central, central, east central, and southwest to Lower Peninsula to 0.41 in the southeast Lower Peninsula. Average temperatures ranged from 5 degrees below normal in the southeast, southwest, and south central Lower Peninsula to normal temperatures in the eastern Upper Peninsula. This was a normal late summer week with moderate but below normal temperatures. Crops are continuing to progress well with the warm and sunny temperatures experienced last week. Some cool overnight temperatures were seen last week as low as 31 degrees in the western Upper Peninsula and 33 degrees in the northwest Lower Peninsula. A grower in the central Lower Peninsula commented, "The wide range in crop conditions is due to both spring rain issues and maturity issues. If we do not get a frost until November, then the crop condition will be greatly improved." Another grower from the east central Lower Peninsula commented, "We will need to get past our normal frost date. If we get a long warm fall we could have some record yields."

Field Crops

Pleasant conditions, and minimal precipitation, helped progress the development of crops in all areas of the State. However, many farmers were still concerned about the development of corn and soybeans prior to the frost. Farmers continued preparing **wheat** fields for the 2010 crop. Activities included liming, spreading manure, spraying and tilling. Continual reports of the 2010 wheat crop could be planted late depending on the harvest of soybeans. **Oat** harvest was all but complete. **Corn** was in growth stages ranging from milk to dent. **Soybeans** were in growth stages R4-R6. The soybeans were still short but had numerous pods. Development of both crops was still behind as heat units still were needed. **Alfalfa** harvest continued, with some farmers receiving a fourth cutting. In the southeast, some farmers have begun to seed new alfalfa. Farmers were putting finishing touches on equipment used for the harvest of **sugarbeets**. Harvest should begin September 12. **Dry bean** advancement continued. Some fields were setting and filling pods. In the Thumb, white mold was a problem.

Fruit

Harvest of Ginger Gold, Williams Pride, Zestar, Mollies Delicious, Jonamac, McIntosh and Gala **apples** was underway in the southwest. **Blueberry** harvest was completed for the most part, with a few growers still harvesting Elliott blueberries. Cresthaven, PF25, Loring, Glowingstar, PF19-007, PF23, PF244-007, PF24C **peaches** were being picked in the southwest; brown rot was common in some orchards. Bartlett **pears** continued to be harvested. In the southwest, Anjou and Bosc winter pears were also being picked. Stanley **plums** were being harvested. In the southwest, harvest of NY9, Italian, Red Heart, and Vision plums was underway. Fall **raspberry** harvest continued. Harvest of Mars, Fredonia, Himrod, Vanessa, and Marquis **grapes** was underway in the southwest; harvest of Niagara grapes is expected to begin in late September. In the northwest, grapes were at veraison.

Michigan Weather Summary for Week Ending 09/07/09 ¹
